

Meta XR - Team 10

Brandon Dodge (EECS) | Asa Maker (EECS) | Zach Severt (EECS) | Josh Dwoskin (EECS) | Jonathan Gott (EECS)

DESCRIPTION & PURPOSE

1. WHAT IS THE PROJECT?

A Meta Quest Pro XR dashboard that displays useful phone-based information as modular heads-up display widgets.

2. WHY IS THE PROJECT BEING DONE?

XR devices are moving toward everyday wearable computing, but current systems do not provide a simple, privacy-focused way to view personal data in real time.

3. WHAT IS IT FOR?

The system helps users view metrics such as health data, notifications, GPS speed, heading, and custom widgets without constantly checking a phone.

4. WHAT IS THE RESULT?

A working XR prototype with a Unity-based dashboard, modular widgets, phone-to-headset data flow, NSDK 4.0 spatial placement, Meta All-in-One SDK integration, and a privacy-first architecture designed for future AR glasses.

Prototype validated on Meta Quest Pro and designed for migration to future Meta AR glasses.

META XR CONCEPT

Real-time information in lightweight Meta AR glasses

META XR SYSTEM DESIGN

Privacy-centered HUD for future Meta AR glasses

Prototype validated on Meta Quest Pro, designed for migration to Meta AR glasses.

Local-first privacy

Modular widgets

Low-latency updates

Future glasses-ready

ETHICAL & INTELLECTUAL PROPERTY ISSUES

Ethical Issues

Personal data privacy: Health, location, and notification data may be sensitive. We address this with explicit permissions, local-first processing, and user-controlled data access.

User consent: Users must understand what data is collected and displayed. The system uses clear opt-in permissions and allows access to be revoked.

Distraction and safety: XR overlays can block attention in real-world environments. The HUD is designed to be minimal, movable, and easy to hide.

Bystander privacy: Pass-through XR systems and future AR glasses may raise concerns around people nearby. The project avoids recording bystanders and focuses on displaying user-owned data.

Intellectual Property Issues

Third-party SDKs: The project uses platform tools such as Unity, Meta XR SDKs, Meta All-in-One SDK, NSDK 4.0, Android tooling, and possible external APIs under their license terms.

Original code ownership: Team-created dashboard logic, widget architecture, spatial integration code, and phone-to-headset communication code are original project work.

Asset attribution: Icons, UI graphics, fonts, and sample assets must be original, open-license, or properly credited.

Brand and trademark use: Meta, Quest, Android, Unity, NSDK, and related names are used only to describe platform compatibility, not as owned project branding.

Privacy, consent, attribution, and license compliance guide responsible XR and AR development.
